

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Interconnection of Large Loads to the Interstate
Transmission System

Docket No. RM26-4-000

SUPPLEMENTAL COMMENTS OF ORACLE AMERICA, INC.

Oracle America, Inc. (Oracle) respectfully submits these supplemental comments on the proposed advance notice of proposed rulemaking that the Secretary of Energy released for consideration and final action by the Federal Energy Regulatory Commission (Commission).¹ As explained in its initial comments, Oracle strongly supports the White House’s commitment to win the “race to achieve global dominance in artificial intelligence (AI)”² and encourages the Commission to bolster U.S. AI dominance by streamlining processes and incentivizing growth for infrastructure deployment both in the United States and in trusted partner/allied nations.³

Oracle submits these supplemental comments so that the record includes important developments that occurred since the Commission solicited comments last fall, namely the White House Ratepayer Protection Pledge⁴ (which Oracle signed) and additional tangible commitments to “paying our own way” on energy.⁵ As a developer and operator of AI infrastructure and AI

applications, Oracle is a leader in investing in technologies at different layers of the AI stack, including in infrastructure such as data centers, upgrades to the power grid, and self generation of power.⁶ Oracle is committed to ensuring that “the data center boom [is] leveraged to address affordability and benefit all American households and businesses,” including by “protect[ing] American consumers from price hikes due to data center energy and infrastructure requirements.”⁷

Oracle is a leading investor and innovator in American AI technologies. Oracle agrees with President Trump that “[d]ata center infrastructure is the foundation of the internet, cloud computing, and AI.”⁸ Oracle also agrees that “to harness the full power of American innovation ..., the development of large-scale data center infrastructure and AI must occur here at home.”⁹ Oracle’s AI applications and its cloud services allow access to multiple data centers in multiple locations, and Oracle is investing heavily in building and operating data centers throughout the United States, with sites in New Mexico, Texas, Michigan, Wisconsin, and presence throughout Illinois, Virginia, Arizona, California, Utah, and several other states.¹⁰ For example, many data centers being built on these sites are through the Stargate project, a partnership to bring in over

\$400 billion in data center investment over three years.¹¹ In addition to promoting U.S. leadership in AI, these data center sites benefit the public by employing thousands of workers during both the construction and operating phases.¹²

Oracle's AI infrastructure investments benefit the public and local communities without raising consumer energy costs. Oracle is a proud original signer to President Trump's Ratepayer Protection Pledge, agreeing to protect Americans from energy price hikes due to data center energy needs and to lower electricity costs for consumers in the long-term.¹³ By signing the Ratepayer Protection Pledge, Oracle affirmed its commitment to pay the full costs of new generation resources and electricity needed to meet the energy demands of its data centers, pay for upgrades to grid infrastructure, and coordinate with grid operators to fortify the power grid.¹⁴

Even before signing the Ratepayer Protection Pledge, Oracle was committed to paying its own way on energy.¹⁵ For example, for some sites, Oracle leverages a utility as our primary power source and negotiates several provisions that should result in rates going *down*, not up, such as:

- Oracle's contract directly funds the capital required for any and all new or upgraded generation or transmission required to support our load;
- Oracle funds any special technology required to protect the public grid from any load swings from our technology, i.e., enhanced uninterruptible power supply or battery storage;
- Oracle is first in line for curtailment in the event of an outage on the grid to ensure the general public has preferential treatment;

- There are very limited penalties for the utility in the event of an outage, and often Oracle is still paying for a minimum power charge even if we are not receiving power; and
- Excess, unutilized power can be used for the broader grid demand in periods of high demand.

When managed correctly, all of the above should result in Oracle not only funding resources that we utilize for our own sites, but also upgrades to aged and undersized resources for public consumption. For other sites, Oracle builds on site power generation that is fully dedicated to our site, and this aims to ensure no adverse effect the public utility grid or ratepayers. In this scenario, 100% of capital, deployment, and operations are funded by Oracle and our partners in private arrangements.

The public grid could benefit from these generation resources, given they are already funded resources and will often have excess, unutilized power. Patchwork state regulation, long interconnection queues, and complex dynamics between transmission and generation operators complicates efforts to implement and integrate Oracle's beneficial investments. Modernizing the regulatory framework could allow large-load customers that self-generate electricity to more directly partner with utilities, transmission infrastructure owners, and others to make excess capacity available to the grid on commercial reasonable terms. This would, in turn, benefit reliability and potentially reduce costs for other customers.

Indeed, these infrastructure upgrades can improve the resiliency and reliability of the power grid for all consumers connected to it, at a time when the nation's electric grid is facing significant needs for systematic repair, replacement, and modernization. Further, when possible, Oracle will make available backup generation resources at its data center sites to prevent

blackouts and power shortages.¹⁶ Oracle’s investments in the power grid thus help “ensure the reliability, resilience, and security of the electric power grid”¹⁷ for these communities.

Oracle will continue developing and deploying the infrastructure needed for the United States to maintain its leadership in AI and win the global AI race. Data centers are the foundation of AI technologies, and operating these sites requires modernizing and expanding the supply of the energy grids to which they connect. Oracle remains committed to ensuring that American consumers are protected from shouldering the costs of investments in the power grid and using these investments to benefit the public at large by bolstering the resilience and reliability of the grid.

Respectfully Submitted,

ORACLE AMERICA, INC.
