Washington, DC 20426

Re: Docket No. RM26-4-000 — Interconnection of Large Loads to the Interstate Transmission System

Dear Secretary Reese:

Maven Solutions respectfully submits the attached research brief, *The Community-Development Gap in FERC Docket RM26-4-000*, for inclusion in the public record of the above-captioned proceeding. This filing is submitted in response to the Commission's October 27, 2025 Notice Inviting Comments and in anticipation of the Commission's forthcoming action, as announced in its April 16, 2026 Order Regarding Intent to Act.

Maven Solutions is an independent consulting practice specializing in technical program management, AI infrastructure governance, and community-impact assessment for large-scale technology deployments. The undersigned has over fifteen years of experience in program management across enterprise technology, merger-and-acquisition integration, and AI platform operations.

The attached brief identifies a structural gap in the docket record. After reviewing the principal categories of comments filed by the approximately 175 organizations that participated in the initial and reply comment periods, Maven Solutions found that no commenter substantively addressed the community-infrastructure dimensions of large-load interconnection — specifically, the workforce housing, education, healthcare, water system, and transportation infrastructure required to sustain host communities that absorb facilities consuming electrical capacity equivalent to mid-sized cities.

The brief examines this gap through the lens of Wyoming, where proposed data center developments would, if fully constructed, exceed the state's total existing electrical generation capacity of approximately 10,200 megawatts. Wyoming's Public Service Commission — which oversees what may be the most disproportionately affected regulatory jurisdiction in the nation relative to existing generation baseline — did not file comments in this docket. The brief documents this absence and presents a ten-dimension community-development evaluation standard designed to assess host-community readiness across the full range of infrastructure systems that determine whether large-load facilities remain viable over multi-decade operational lifecycles.

Maven Solutions offers this research contribution in the interest of ensuring that the Commission's forthcoming regulatory framework accounts for the complete set of infrastructure conditions that determine whether large-load interconnection is not only technically feasible and legally durable, but

operationally sustainable for the communities where these facilities are sited. The community-development standard proposed in the brief is intended as a practical evaluation tool, not a prescriptive regulatory mandate.

Maven Solutions appreciates the Commission's consideration of this submission and welcomes any opportunity to provide additional information or clarification as the proceeding advances.

Respectfully submitted,

Jayne Algermissen

Senior Technical Program Manager & Principal
Maven Solutions
